### Abstract

The holder consists of two half shells (11,12) with thin rigid walls and more or less identical in shape, each with a number of compartments (13,14) situated side by side and having dimensions which enable them to hold an exact and predetermined number of counters (18) set on edge. The compartments have trough-shaped bases (39,40) which form inner surfaces to receive the counters and external recesses (30) for stacking. The half shells have shaped edges along their parting plane (P-P') which enable them to be joined together, and their walls are at least partly transparent so that their content are visible.
